OPERA SPEAKER CABLE SPOOLS

OPÉRA
★★

Designed to offer a simple and versatile solution for all Hi-Fi and home cinema installations, the OPERA range of speaker cables provides a high-quality connection between your amplifier and your passive speakers.

Available by the metre or in 5, 10 or 100 metre spools in 2.5 mm² cross-section, and in 100 metre spool for the 4 mm² version, OPERA offers great installation freedom and easily adapts to all configurations, from compact systems to full integration. The conductor is made of oxygen-free copper (OFC), covered with a thin layer of tin. This treatment naturally limits metal oxidation while ensuring stable signal transmission.

The structure and braiding of the strands induce a direction of conductivity, so the sheath is marked to indicate the direction of the signal, from your amplifier to your speakers.

The outer PVC sheath provides effective insulation and mechanical protection for the conductor. This material also offers the advantage of good flexibility, making installation easy. Affordable and functional, OPÉRA cables adapt to all needs, making them an ideal solution for any installation combining ease of use and high-quality sound.
